# COMP1511/COMP1911

## Week 5!

M13B: 1pm – 4pm || T11X: 11am – 2pm

Tutors: William (me!) + Jason || Daniel

# My GitHub:

---

[https://github.com/william-o-s/unsw\\_comp1511\\_tutoring](https://github.com/william-o-s/unsw_comp1511_tutoring)

# Reminders (also, this is a check-in week!)

---

## Week 6

Week 6 does not  
have tutorials  
(you are  
welcome to rock  
up)

## Assignment 1: CS Sokoban

Brief:  
<https://cgi.cse.unsw.edu.au/~cs1511/24T2/flask.cgi/assignments/ass1/index.html>

## Demo: Help Sessions

Timetable:  
<https://cgi.cse.unsw.edu.au/~cs1511/current/flask.cgi/help-sessions/>

# Tutorial Agenda:

---

Part 1

Part 2

Part 3

2D arrays are almost identical to 1D arrays

```
// 1D Array
int array_1d[3] = { 1, 2, 3 };
int array_1d_all_zeros[10] = { 0 };

// 2D Array
int array_2d[3][3] = { { 1, 2, 3 }, { 4, 5, 6 }, { 7, 8, 9 } };
int array_2d_all_zeros[10][20] = { 0 }; // yes, this is exactly the same
```

Functions have their own 'scopes', or, are their own 'boxes'

```
int main(void) {
    int x = 0;
    another_function();
    return 0;
}

void another_function() {
    int x = 1;
    // this doesn't affect the "x" in main()
}
```

Let's briefly recap how input works in the terminal

# 2D arrays are almost identical to 1D arrays

---

*// 1D Array*

```
int array_1d[3] = { 1, 2, 3 };
```

```
int array_1d_all_zeros[10] = { 0 };
```

*// 2D Array*

```
int array_2d[3][3] = { { 1, 2, 3 }, { 4, 5, 6 }, { 7, 8, 9 } };
```

```
int array_2d_all_zeros[10][20] = { 0 };    // yes, this is exactly the same
```

...including array indexing...

---

	Col1	Col2	Col3	Col4	....
Row1	Arr[0][0]	Arr[0][1]	Arr[0][2]	Arr[0][3]	
Row2	Arr[1][0]	Arr[1][1]	Arr[1][2]	Arr[1][3]	
Row3	Arr[2][0]	Arr[2][1]	Arr[2][2]	Arr[2][3]	
Row4	Arr[3][0]	Arr[3][1]	Arr[3][2]	Arr[3][3]	
⋮					

...or reading then printing...

---

```
// Reading and printing the first element  
printf("%d", array_1d[0]);  
printf("%d", array_2d[0][0]);
```

...or writing to an index

---

```
// Writing into the first element  
array_1d[0] = 7;  
array_2d[0][0] = 7;
```

# Let's write a galaxy program!

---

# Functions have their own 'scopes', or, are their own 'boxes'

---

*invisible wall*

```
int main(void) {  
    int x = 0;  
    another_function();  
  
    return 0;  
}
```

```
void another_function() {  
    int x = 1;  
    // this doesn't affect the `x` in main()  
}
```

# Refactor the galaxy program with functions + add a sum function

---

# Let's briefly recap how input works in the terminal

---

**NOISE TO SIGNAL** RobCottingham.com  
@robcottingham

```
Terminal
me: $ whois AGoodDog
You are! You are!
```

# The user (that's you!) gives some input to the terminal

---

**NOISE TO SIGNAL** RobCottingham.com  
@robcottingham

```
Terminal  
root@~$ whois AGoodDog  
You are! You are!
```

Input  
"comp1?11"

# The terminal stores all input characters in a buffer

**NOISE TO SIGNAL** RobCottingham.com  
@robcottingham

Input

'c' → 'o' → 'm' → 'p' → 'l' → '?' → 'l' → 'l'

# The buffer contains every 'next' character

**NOISE TO SIGNAL** RobCottingham.com  
@robcottingham

```
Terminal
root $ whois AGoodDog
You are! You are!
```

scanf

# Are all strings arrays? Are all arrays strings?

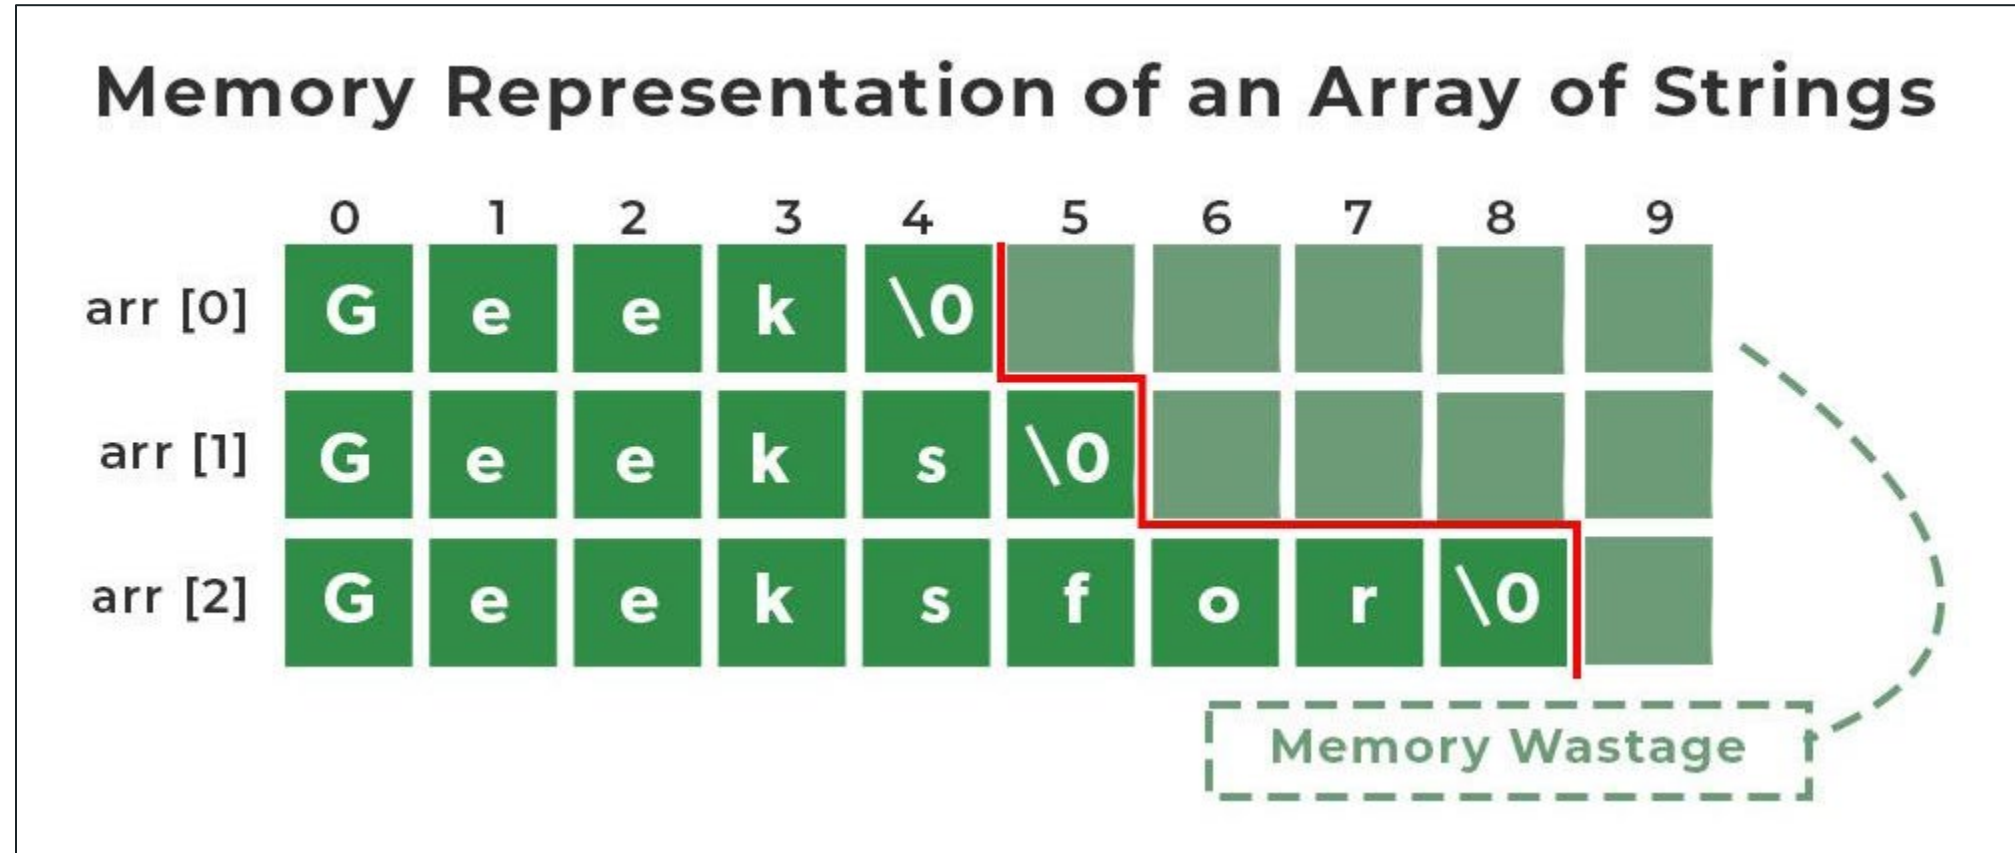

---

A horizontal array of 13 colored boxes, alternating between pink and blue. The boxes contain the following characters in order: 'h' (pink), 'e' (blue), 'l' (pink), 'l' (blue), 'o' (pink), ' ' (blue), 'w' (pink), 'o' (blue), 'r' (pink), 'l' (blue), 'd' (pink), '!' (blue), and '/0' (pink).

'h'	'e'	'l'	'l'	'o'	' '	'w'	'o'	'r'	'l'	'd'	'!'	'/0'
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	------

# Strings are stored as arrays, and always have a null terminator

```
// part3_simple_string.c
//
// This program was written by Sofia De Bellis (z5418801)
// on March 2024
//
// This program demonstrates how to work with strings in C.
```

```
#include <stdio.h>
```

```
#define MAX_SIZE 1024
```

```
int main(void) {
    // Declare and initialise a string
    char my_string[] = "Hello world!";

    // Traverse the string and print each character
    int i = 0;
    while (my_string[i] != '\0') {
        printf("%c", my_string[i]);
        i++;
    }
    printf("\n");
}
```

```
// Another way to traverse the string and print each character
for (int i = 0; my_string[i] != '\0'; i++) {
    printf("%c", my_string[i]);
}
```

# Any questions on how this code works?

```
// How to print a string in its entirety
printf("My string: %s\n", my_string);
```

```
// Declare a string
char another_string[MAX_SIZE];
```

```
// Read a string from the user, note we DO NOT use scanf for strings
printf("Enter a string: ");
fgets(another_string, MAX_SIZE, stdin);
```

```
// Print the string using fputs
fputs(another_string, stdout);
```

```
return 0;
```

```
}
```

# Finally, let's do group exercises to practice (but first, an easter egg!)

---

## VSCode Shortcuts

- Start with Ctrl+Shift+P
  - "Toggle Multi-Cursor Editor"
  - Convert text casing: (highlight text) → Ctrl + Shift + P → "Transform to ..."
- Multiple Cursors: Ctrl + Click anywhere
  - Cursor over multiple lines vertically: Shift + Alt + Click on line
- Duplicate Line: Ctrl + Shift + Alt + Up/Down Arrow
- Move Lines: Alt + Up/Down Arrow
- Change All Occurrences: Ctrl + Shift + L or Ctrl + D
- Indentation: (Highlight line/lines) → Ctrl + Left/Right Square Bracket
- Find and Replace: Ctrl + F → (click dropdown) → Replace next
